TITLE: Glued joints in shipbuilding

SOURCE: Sudostroyeniye, no. 8, 1966, 54-58

TOPIC TAGS: marine engineering, glue, glue welding, metal gluing, fiberglass, reinforced plastic

ABSTRACT: The authors study various types of glued joints, select the best types of glue for their respective uses and test glued joint specimens for strength. The results of this study showed that the use of metal, plastic-composition and combination glued joints is feasible in shipbuilding. Static load and vibration testing showed that glued steel and fiberglass-reinforced plastic joints are as strong as welded joints and further that glued joints made of light alloy and fiberglass-reinforced plastics are stronger than welded joints. It was also shown that a glued joint incorporating two fiberglass-reinforced plastic members may be stronger than a single unit made up of pure fiberglass-reinforced plastic. It is suggested that a series of designs be put forth which can be realized completely by gluing in order to make the introduction of glued, glued-welded and glued-riveted joints easier. Among other recommendations is standardization of boatbuilding and mechanizing gluing. Orig. art. has 3 tables.

Shale coke as raw material and fuel in cement industry.
V. A. Andreev (Cement Plant, Leningrad). Тримент 20,
№ 4, 1-6 (1947). Satisfactory portland cement clinker
was obtained by firing mixts. of coke and limestone with
1:3, 1:2, and 1:1 coke-gas coal mixts. The coke contained
CaO 37-20, mineral ash 06.8, and combustibles 17-12%
and had a heat capacity of 1100-370 kcal.; the clinker con-
tained SiO₂ 21, Al₂O₃ 9.6, Fe₂O₃ 5.0, CaO 64.4, MgO 2.04,
and SO₃ 0.30%; the SiO₂ coeff. was 0.90; C.S. 55.8, C.S.
18.6, C.A. 6.7, and C.I.P. 10.0%. The crushing strength of
1:3 specimens after 3, 7, and 28 days was as high as 359,
475, and 605 kg./sq. cm., resp. Up to 15% ash was pro-
vided to clinker by the 1:1 fuel mixt. and about 7.5% by
the 1:2 mixt.

TITLE: Electrical Spring Dynamometer for Measuring Moment of Friction
(Elektropruzhinnyy dinamometr dlya izmereniya momenta treniya)

PERIODICAL: Zavodskaya Laboratoriya, 1957, Vol. 23, No. 1, pp. 102-103

ABSTRACT: The authors compare various systems of measuring the moment of friction, such as dynamometers operating with springs or weights. The weights are found to give more accurate results but to be very time-consuming. They describe a new dynamometer developed by them which uses electrical principles similar to those of the selsyn for recording the moment of friction produced by a spring. A diagram showing the principle of this dynamometer is presented. Tests showed that for moment of friction up to 90 kg/cm the accuracy of recording was $\pm 0.5\%$.

TITLE: A study of the dependence of the principal physicomechanical properties of elastic polyurethane foams on technological factors. Part 1.

CITED SOURCE: Nauchno-issled. tr. Vses. n.-i. in-t plenochny materialov i iskusstv. kozhi, sb. 15, 1964, 44-52

TOPIC TAGS: polyurethane, foam plastic, elastic foam, polyurethane density, polyurethane mechanical property, polyurethane foam manufacture, foam plastic mixing, toluylene diisocyanate, foam coefficient, pore size

TRANSLATION: A study of the dependence of the principal physicomechanical properties of polyurethane foams on the technological factors which have an effect on their quality was carried out on the UBT-65 industrial mixing and casting machine and on the SSK-1 laboratory installation (standard mixing chamber), developed by VNIIPIK, which is an industrial machine in miniature. The rate of rotation of the cross-shaped blade mixer was 3,000, 4,000 and 5,000 rpm, the angle between

Card 1/2

48587-65

ACCESSION NR: AR5005877

the blades and the axis of the shaft was 95°, and power of the compressor was 5 atmospheres. The results showed that the strength of polyurethan foam depends primarily on its density, which is directly related to its water content and the stoichiometrically corresponding content of toluylene diisocyanate. The foam coefficient affects both the physicomechanical properties (the elasticity of polyurethan foam is reached at a foam coefficient of 30-110%) and the exothermic nature of the chemical reactions (maximal at a foam coefficient of 100%). As the foam coefficient decreases, the rupture strength also decreases, while the relative and residual elongation are increased. The pore size is affected by surface-active agents (it is recommended that paraffin oil, silicone derivatives, etc. be added to increase the pore size) and by a change in pressure in the mixing chamber produced by matching of the diameter of the reducing disk to the overflow pipe. It was found that polyurethan foam acquires stable physicomechanical properties only after 48 hours, not 24 hours. The quality of polyurethan foam is affected by the rate of rotation of the mixer, the temperature of the raw material ($\leq 18^{\circ}\text{C}$) and its properties, the presence of air inclusions in the polyether, etc.

SELF-EXTINGUISHING ELASTIC FOAMED POLYURETHANE (USSR)

Sidorov, V. A., I. M. Zverev, V. P. Aref'yev, and V. D. Samsonov.
Plasticheskiye massy, no. 4, 1963, 69-70. S/191/63/000/004/014/015

Self-extinguishing elastic foamed polyurethane ППУ has been prepared by adding up to 25 parts of tricresyl or trichloroethyl phosphate to 118 parts of the polyurethane starting material. The new material can be produced with existing equipment. The physical and mechanical properties of experimental self-extinguishing ППУ were shown to meet the ТУ 35 XII-395-62 r. specifications, but addition of phosphates considerably lowers the heat resistance of ППУ. The self-extinguishing ППУ is easier to make with tricresyl than with trichloroethyl phosphate, and the product has better physical and mechanical properties. [BAC]

TITLE: A generator for normal distributions of random numbers for a Ural-1
electronic computer. Class 42, No. 16929C

SOURCE: Byulleten' izobreteniya i tovarnykh znakov, no. 6, 1965, 73

TOPIC TAGS: normal distribution, random number generation/Ural 1 electronic
computer

ABSTRACT: This Author Certificate presents a generator of normally distributed
random numbers for a "Ural-1" electronic computer. The generator includes an
equally probable data unit and is designed to increase the generation speed of
normally distributed numbers. It contains "I" circuits with their inputs connected
to the reference number register, whose outputs are connected to the machine adder.
The generator also contains a control circuit with the respective orders of the
register connected in series to the adder. The input of the adder is connected to
the central controlling device of the machine, and the outputs of the adders are
connected with the controlling elements of the gate group.

3090. BLOOD PROTEINS AS A SUPPLEMENTARY SOURCE OF HISTIDINE AND TRYPTOPHAN IN DIETETICS (Russian text) - Sharpenk A. E., Arefeva A. S. and Karpysheva V. S. Botkin Hosp. and Inst. of Nutrit., USSR Acad. of Med. Scis, Moscow - VOPR. PIT. 1956, 15/3 (22-26) Tables 3

Attempts were made to find supplementary sources of protein nutrients containing in abundance certain amino-acids. The investigated products included dried slaughter-house blood and fresh blood taken from domestic animals. It has been found that meals which contained dried blood were well tolerated by patients, even those suffering from diarrhoea and active gastric ulcer. Dried slaughter-house blood and blood from animal donors were found to be valuable sources of protein with a very high histidine content and rich in tryptophan. It is recommended that dried blood should be widely used in hospital diets. References 7.

ORG: Institute of Applied Geophysics (Institut prikladnoy geofiziki)

TITLE: Results of a study of the wind regime in the meteor zone by the radar method

SOURCE: Geomagnetism i aeronomiya, v. 6, no. 4, 1966, 703-706

TOPIC TAGS: atmospheric wind, meteorologic radar, signal to noise ratio

ABSTRACT: The method and results are presented of a study of wind circulation in the upper atmosphere conducted during the first half of 1964 near Moscow (56° N). The wind circulation was measured by radar tracking of meteor trail drifts at altitudes of 85—110 km.

The radar equipment used in the measurements had a coherent pulse output modulating a 33-Mc carrier. The pulse duration, repetition frequency, and power were 10 μ sec, 500 cps, and approximately 100 kw, respectively. A form of coding was used in which every fifth pulse was distinct. A two stack transmitting antenna consisting of four 5-element Yagi antennas was employed. The receiver antenna had only one 5-element section. The

Card 1/4

UDC: 523.53:551.510.53

ACC NR: AP7003025

receiver sensitivity thus achieved was 2—3 μ V at a signal-to-noise ratio of two. The display and recording equipment was triggered by the received pulses and was protected from spurious noise by 1) utilization of the coincidence of two consecutive marker pulses for correlating purposes, 2) pre-selection by repetition frequency discrimination, and 3) spurious signal suppression using a special detuned noise receiver. The displayed frames were filmed. Each frame contained information on the distance from the point of reflection of the transmitted pulse, the meteor echo diffraction pattern, the Doppler shift pattern, the date and time, and the antenna direction.

The horizontal component of the unit velocity of meteor trail movement was obtained from direct readings of the radial trail velocity components as recorded by the Doppler shifts. The direction of meteor trail movements was determined from the Doppler shift phase difference obtained at the outputs of two phase detectors in which the reference signals were approximately in quadrature.

The drift velocity readings had considerable fluctuations and, for this reason, were averaged on an hourly basis. The averages were used to study diurnal wind pattern changes. In order to secure meaningful averages using the equipment at hand (based on at least 50 measurements/hr),
Card 2/4

ACC NR: AP7003025

measurements were made alternately, first in the NS and then in the EW directions. The results obtained at the same time of day but for different days were combined. Thus, about 7000—9000 individual readings were recorded during one 5—7 day measurement session.

On the basis of the observation results, it was established that the magnitude and direction of winds varied from day to day and from month to month. The experimental curves of wind velocities were analyzed by Fourier series, i. e., they were reduced to a constant component and three harmonics (corresponding to 24-, 12-, and 8-hour variations). The second harmonic was predominant. The velocities of the zonal wind components attained maximum values of 20—30 m/sec in April and June. These velocities were lowest during January and March (1—5 m/sec); during February and May they were 12—15 m/sec. The direction varied from easterly during February and March to westerly during the April—May period, and again to easterly in June. The meridian wind components were directed to the south during every month except March. The magnitudes of these components varied from 5 to 18 m/sec; the maximum was observed in March.

Comparison of these results with the published data from similar studies at Manchester and Khar' koy established that similarities exist in
Card 3/4

ACC NR: AP7003025

the monthly variations and that in all three cases the wind velocities decrease during spring and summer. The curves of the meridian wind components exhibit certain similarities, but the zonal component curves show closer agreement. The data are different when the relative magnitudes of the wind velocities for the three locations are considered. Both wind components at Manchester were weaker than those studied in the USSR. This is attributed to the different climatological conditions at the points of observation and to the different times of observation with respect to the 11-year solar activity cycle. priborov pri Sov. Min. SSSR, 1960. vyp. 49 (109), 13-23)

TEXT: The authors describe a new gas thermometer of improved precision. They give results of measurements of thermodynamic equilibrium temperatures between liquid and solid Au, and between liquid and solid Zn, and study the instrumental errors with which the parameters of the thermometer had been determined. The improved design of the manometer and the use of new units increased the precision of pressure measurements. [Abstracter's note:

("Tr. in-tov Kom-ta standartov, mer i izmerit. priborov pri Sov.
Min. SSSR", 1961, no. 51 (III), 23-34)

TEXT: A description is given of the design of a gas-filled thermometer
built by the VNIM. Used in the thermometer are quartz tanks and capillaries
which secure high-precision measurements of the sizes of idle space and of the
heat expansion of the tank. To separate the working gas from the gas causing a
pressure on the mercury, a special chamber is used. The chamber is a zero
membrane-pressure gage with an error not exceeding ± 1.4 Hg. A specially-designed
capacitive-type (Ref. 5A148) gage serves as a reading instrument. The thermo-
meter is used for measuring the solidification points of zinc and gold, which are
found to equal to 419.57 ± 0.02 and 1064.4 ± 0.2 C, respectively.

TITLE: Temperatures of thermodynamic equilibrium between solid and liquid zinc and between solid and liquid gold
PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk. 32. Izmeritel'naya tekhnika, no. 11, 1962, 37-38, abstract 32.11.290. "Tr. in-tov Kom-ta standartov, mer i izmerit. priborov pri Sov. Min. SSSR", no. 51 (11), 1961, 23-34

TEXT: Description is given of a constant-volume gas thermometer designed by the VNIIM for determining the melting and freezing points of zinc and gold. The quartz-glass thermometer well with a volume of 120 to 180 cm³, is provided with a quartz capillary tube 0.4-0.7 mm in diameter and 400-500 mm long. This tube is connected by a 0.5 mm stainless steel capillary tube to the separation chamber and through it, to a mercury pressure-gage. The thermometer well is filled with pure nitrogen, whose pressure, at the temperature of the ternary point of water, is selected so that, at the temperature to be measured, it will be close to the atmospheric pressure. The separation chamber represents a zero-differential manometer. The sensitive diaphragm mounted in the chamber separates the working gas in the well from the gas that exerts pressure

Card 1/2

Temperatures of termodynamic equilibrium between...

S/263/62/000/011/013/022
I007/I207

on the mercury, thus permitting the pressure of both gases to be equalized. Displacement of the diaphragm is controlled by the capacity method through an a.c. bridge, with an error not exceeding 1 micr. Hg. The mercury pressure-gage provided with capacitive blocking of the mercury level, ensures a measuring accuracy of ± 3 micr. Hg. Methods of melting of zinc are described with maximum impurities of 0.0003% and of determining the thermodynamic freezing point of gold having an impurity limit below 0.0001%. Measurement results are given and the total measuring error is computed. On the strength of these results the temperature of $419.57 \pm 0.2^{\circ}\text{C}$ was found to be the most probable temperature of the rmodynamic equilibrium between solid and liquid gold while $1064.5 \pm 2^{\circ}\text{C}$ seems to be the most the probable freezing point of silver. There are 5 figures and 8 references.

TITLE: Catalytic action of metallic compounds on the reaction of isocyanates with hydroxyl-containing compounds (Part I)

SOURCE: L'akokrasochnyye materialy i ikh primeneniye, no. 1, 1965, 3-5

TOPIC TAGS: isocyanate copolymer, polyester synthesis, metal acetate, polymerization catalyst, metal naphthenate, toluylenediisocyanate, hydroxyethyl adipate

ABSTRACT: In a study of the catalytic action of Na, Li, K, Rb and Cs acetates (1), Ba, Ca, Mg and Be acetates and naphthenates (2), and Co, Cu, Fe, Mn, Cd, Ti and Al normal naphthenates (3) on polyester synthesis, the authors reacted a stoichiometric proportion of 2, 4-toluylenediisocyanate and di- β -hydroxyethyl adipate in cyclohexanone at 50°C at a total concentration of 0.575 μ for both, adding 0.00066 mol (1) or 0.0066 mol (2, 3) of the catalysts per liter. A setup made up of a conical flask with a mercury-sealed mixer and a reflux condenser, connected with an argon feeder and placed in a thermostat, was used for the reaction rate studies. 4-hr. observations of the reaction indicated a strong catalytic action of the alkali metals and metals with variable valence and no

noticeable action of the alkaline earth metals. The activity of the alkali metals was found to decrease in the order Cs > Rb > K > Na > Li with the electronegative potential.

TITLE: Infrared spectroscopic study of the effect of metals on the reaction of formation of polyurethanes. Report No. 2.

SOURCE: Lakokrasochnyye materialy i ikh primeneniye, no. 4, 1965, 1-4

TOPIC TAGS: sodium compound, cobalt compound, polyurethane, IR spectroscopy

ABSTRACT: The reaction forming urethanes in the presence of sodium acetate and cobalt naphthenate catalysts was studied by means of IR spectroscopy, which makes it possible to follow the reaction between the isocyanate and the hydroxy ester and to establish the presence of side reactions. The starting reagents were 2,4-toluylene diisocyanate and di- β -hydroxyethyl adipate. The IR spectroscopic method revealed a difference in the catalytic effect of salts of alkali metals and metals of variable valence: in addition to the main reaction forming urethane, side reactions occur in the presence of alkali metals (sodium acetate). It was found that as the concentration of the sodium salts decreases, the rate of the

side reactions also decreases. Cobalt salts are recommended as effective catalysts for the preparation of polyurethanes. Orig. art. has: 7 figures, 1 table, and 5 formulas.
